

Ason is a fiber optic communication network device

Overview

Automatically Switched Optical Network (ASON) is a concept for the evolution of transport networks which allows for dynamic policy-driven control of an optical or SDH network based on signaling between a user and components of the network. Its aim is to automate the resource and connection. Optical-layer ASON, also known as WSON, groups OCh wavelength services through wavelength selective switching (WSS). Dynamic rerouting is based on dynamic optical cross-connections. It's a traffic protection and restoration, mechanism used in high capacity networks. Traditionally, it was necessary to configure cross-connections in the Network Elements (such as an optical switch) to create a new. **ASON (Automatically Switched Optical Network)** in an **OTN (Optical Transport Network)** is a control plane technology that enables dynamic, intelligent, and automated provisioning, management, and restoration of optical connections.

Ason is a fiber optic communication network device

An Automatically Switched Optical Network (ASON) is an "intelligent" optical network that can automatically manage the signalling and routing through the network.

Automatically Switched Optical Network (ASON) is a revolutionary technology that enables dynamic, automated management of optical networks. ASON is designed to improve the ...

ASON transforms OTN from a static transport network into a ****self-configuring, self-healing, and intelligent optical network****, making it ideal for modern high-bandwidth, low-latency ...

Automatically Switched Optical Network (ASON) is a concept for the evolution of transport networks which allows for dynamic policy-driven control of an optical or SDH network based on signaling ...

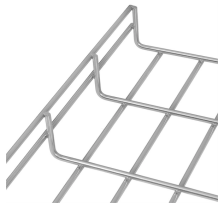

ASON stands for Automatically Switched Optical Network. It's a traffic protection and restoration, mechanism used in high capacity networks. We use ASON in mesh optical network ...

Optical-layer ASON, also known as WSON, grooms OCh wavelength services through wavelength selective switching (WSS). Dynamic rerouting is based on dynamic optical cross ...

Automatically switched optical network (ASON) is an optical transport network that has dynamic connection capability. This capability is accomplished by using a control plane that performs the call ...

Automatically switched optical network (ASON) is an optical transport network that has dynamic connection capability. This capability is accomplished by using a control plane that performs the call ...
