

Automatic Detection of Distribution Network Terminals

Overview

It is designed for real-time monitoring of power distribution lines, performing fault detection, fault waveform recording, fault section pinpointing, risk alerting, and power quality analysis. Moreover, fault detection methodologies should remain robust to evolving grid topologies caused by factors such as reconfigurations, equipment failures, and Distributed Energy. Authors: Prof. Pujari, Prajakta Santosh Suryawanshi, Sanket Shantinath Khot, Prathmesh Rajendra Pharne, Aditya Arvind Patil DOI Link: <https://doi.66160> Certificate: View Certificate Our project focuses on developing a cutting-edge, internet-based fault. As an important part of the ubiquitous power Internet of Things, the distribution Internet of Things can further improve the automation and informatization level of the distribution network. The reliability of the measurement data of the low-voltage terminal unit, as the sensing unit of the sensing. Siemens Distribution Automation functionality ranges from monitoring to fully automated applications, including FLISR (fault location, isolation and service restoration), voltage and reactive power compensation and power quality.
