

High Temperature Resistance Selection Guide for Aviation Electronics-Grade Optical Core Routers

Overview

It captures in one document, under suitable subject heading, fundamental design guidelines for multiple general electronic specifications. AeroPaks offer a cost-effective and convenient way to access the 8,000+ SAE aerospace standards, specifications, recommended practices, and resource documents available in SAE MOBILUS. In addition, AeroPak customers can now search and download any of the nearly 15,000 historical versions of SAE's. For engineers in telescope manufacturing and satellite payload design, the challenge is twofold: achieving dimensional stability using thermally stable substrates against extreme thermal cycling, and maintaining clarity via radiation-hardened coatings under sustained radiation exposure. The aerospace material standards allow various companies around the world to test these materials in order to evaluate their thermal, optical, The NASA Parts Application Handbook (MIL-STD-978) has been prepared to provide a source of technical information for NASA centers and NASA contractors and to maximize

standard part usage. Advanced deposition techniques can improve coating adhesion and density, enhancing their resistance to space conditions.

High Temperature Resistance Selection Guide for Aviation Electronics

The aerospace material standards allow various companies around the world to test these materials in order to evaluate their thermal, optical, mechanical, chemical, and electrical properties.

This invited paper presents a summary of qualification data and tests applied for harsh environment optical interconnect solutions and more especially optical transceivers.

These can be used wherever high capacitance stability with temperature is required, or where a specific characteristic is required to compensate for temperature variations of other circuit components.
