

# How much fiber optic cable does a router need

## Overview

For fiber, your router needs the right WAN connection, speed support, and Wi-Fi capabilities. Routers designed for DSL (which uses phone line inputs) or cable (which uses coaxial inputs) won't. Your existing cable modem won't work with fiber service, and you'll need devices specifically engineered to convert optical signals into data your devices can use. Fiber internet relies on specialized equipment to deliver its high-speed, reliable performance. Unlike your current router, however, a fiber router is made to handle fiber. The process to connect fiber optic cable to router requires careful attention to detail, but I'll walk you through every critical step with the precision and clarity you deserve. This comprehensive guide combines industry standards with field-tested practices to ensure you achieve a rock-solid. The fiber optic cable from the street terminates at the ONT, and then an Ethernet cable connects the ONT to your router. While the provider usually dictates the exact placement of the ONT based on where the fiber enters your home, it's beneficial to consider its location. \* For larger homes, mesh.
