

How to use an ODN optical splitter

Overview

This guide focuses on two critical aspects of optical splitters that define FTTH performance: split ratios (how signals are divided) and splitting architectures (how splitters are deployed). At the heart of efficient ODNs lie passive splitters, crucial components responsible for distributing optical signals to multiple users without requiring any electrical power. You may be confused about how Even Splitting and Uneven Splitting differ—or which one to choose for your network. Every choice related to splitter ratio, placement, and integration directly affects: For ISPs and FTTH contractors, misunderstandings around PLC splitters are one of the most common root. By dividing a single optical signal from a central Optical Line Terminal (OLT) into multiple outputs for Optical Network Terminals (ONTs) at users' homes, splitters eliminate the need for dedicated fibers to each residence—slashing infrastructure costs while scaling network reach.

How to use an ODN optical splitter

Network designers and ISPs aiming for efficiency must focus on effective passive optical network design, with careful consideration of PON architecture planning and splitter placement.

By combining Even or Uneven Splitting with LongXing's pre-connectorized ODN-GP31-2P18PC, planners achieve cost-effective, efficient, and error-free FTTX deployments.

This essay delves into the intricacies of ODN passive splitters, exploring their types, functionalities, advantages, disadvantages, applications, key specifications, and future trends.
