

Interconnection of Optical Modules and Switches

Interconnection of Optical Modules and Switches

To overcome these limitations, a new generation of optical interconnect technologies has emerged. LPO (Linear-drive Pluggable Optics), NPO (Near Package Optics), and CPO (Co ...

Today, 800G optical transceivers are widely deployed in modern AI data centers to support high-performance GPU networking. As AI clusters continue to scale, the industry is moving ...

The Consortium for OnBoard Optics (COBO), led by Microsoft, is defining the standard for optical modules that can be mounted or socketed on a network switch or adapter motherboard.

What Is Co-Packaged Optics (CPO)? Co-Packaged Optics (CPO) is an architectural approach that integrates optical engines directly alongside switch ASICs on the same substrate.

The solution simplifies transport between data centers by replacing stand-alone optical transponders with the Cisco ® portfolio of standardized ...

This research program unites material and tool suppliers, foundries, IDMs, OSATs, fabless and system companies in the exploration of optical I/O technologies.

Efficient cost-effective optical integration approaches are necessary for optical interconnects to realize their potential for improved power efficiency at higher data rates

Co-Packaged Optics (CPO) has long promised to transform datacenter connectivity, but it has taken a long time for the technology to come to market, with tangible deployment-ready products ...

Learn how optical interconnects power AI-driven data centers with massive bandwidth, ultra-low latency, and sustainable scalability.

In this paper, we present a review of optical switching techniques capable of meeting the requirements of the next generation of large-scale data center networks.

As generative AI models scale rapidly, the primary data-center bottleneck is shifting from transistor performance to interconnect bandwidth and latency.
