

## Light Map Module

### Overview

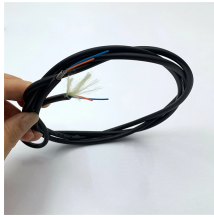

Photos taken with a camera or mobile that has built-in GPS are the easiest to work with in the Lightroom Map module. As long as GPS is enabled, the camera saves the exact location an image was shot in the photo's EXIF data. Lightroom reads the data when you import the photos and automatically adds them to the map. For example, I made this photo use. Some camera manufacturers make GPS units that you can connect to the camera body. If you have one of these it does exactly the same as a built-in GPS unit. It embeds the camera's coordinates in the EXIF data of your images. That data is then read by Lightroom when you import the photos. Most mobile phones have built-in GPS. You can download apps that record your route and let you export that information in a GPS tracklog (extension type.gpx) file that you can import into Lightroom. Some fitness devices like sports watches and fitness bands have the same functionality. The effectiveness of this depends on how often the app or device. Here's an easy method to add GPS data to your

photos if you have a mobile phone with built-in GPS. All you have to do, whenever you take a photo with your camera, is remember to take an additional photo with your mobile phone. You can import these into Lightroom and add them to the same Collection. Once you have done so, simply drag the photos take. The Lightroom Map module is an often under-utilized but surprisingly useful tool. Using these ideas you can add Gcoordinatestes to any photo, even those taken by a camera without GPS. In years to come, you can find out exactly where your photos were taken, even if you can't remember. It makes revisiting your favorite locations a much easier and mor.
