

Multimode fiber transmission distance 6

Overview

MMF supports high data rates—up to 100 Gbps—over distances typically ranging from 300 to 550 meters, depending on fiber type (OM3, OM4, OM5). Multimode Fiber (MMF) has a core diameter, typically 50-100 micrometers, has ability to transfer multiple modes of light through the fiber core, uses lower-cost electronics (LED, VCSEL) operates at the 850 nm and 1300 nm wavelength and is used for short distance interconnections (up to 550m). Multimode optical fiber is a type of optical fiber mostly used for communication over short distances, such as within a building or on a campus. Multi-mode links can be used for data rates up to 800 Gbit/s. How. Multimode fiber optic cables are designed to carry multiple light modes simultaneously, each taking a different path or mode through the fiber. This characteristic makes MMF ideal for high-bandwidth applications over relatively short distances. It typically uses a larger core diameter (50 μ m or 62.
