

New Developments in Optical Cables

Overview

The demand for faster transmission speeds is fueling innovation in fiber optic cable design. According to BIS Research, the next-generation global optical fiber market—including multicore and hollow-core fiber—is projected to reach \$1.05 billion by 2031, growing at a CAGR. According to a recent study by the Fiber Broadband Association and RVA, 76.5%) are now serviceable by fiber—an increase of 13% in 2024. As the industry looks ahead, six major trends are shaping the future of fiber. In the last year, the major developments in fiber optic components greatly improved fiber density in networks and installations. Optical fibers are slender, flexible strands that transmit light signals over long distances with minimal loss of signal strength. Single-mode has that tiny core, usually around 8-10 micrometers across, which lets just one light path travel through. Because of this setup, it works really well for those long.
