

One module has light and the other does not

Overview

The module is either powering up or has powered up successfully and does not have a connection to the controller or the controller is in Program mode. I often find my sticks don't match, I cue not the greatest when it comes to ram rgb. I assume its not stuck in a hardware profile?

have you set hardware/software. The LDR light sensor is very affordable, but it requires a resistor for wiring, which can make the setup more complex. These issues affect braking safety and traction stability.

One module has light and the other does not
