

Pipeline Crossover Connection

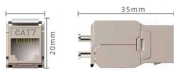

Overview

Crossover pipeline assemblies are often installed as part of looping projects to connect the new segment to the main pipeline. Crossovers can also be used to reroute gas to an adjacent pipeline when pipeline maintenance is required, allowing for uninterrupted natural gas. A crossover is a one piece tubular section used to join or change two different components with different size of tube, or type of connection. These components can be casing, tubing, drill pipe or combination. OD: All combinations available from 2" to 24" Crossovers are also known as Xover, XO. Crossover connectors route your line around existing pipe, tubing, or obstructions. Jaws for copper tube sizes ½ to 2 fit directly into the included crimping tool. These fittings are manufactured from high-strength alloy steel forgings and fully heat-treated to guarantee consistent quality throughout. This article offers an in-depth exploration of crossover joints, covering their types, materials, standards, typical.
