Engineers use an SLD DWG to communicate the overall power distribution layout—from the incoming utility or generator source to main switchgear, busbars, feeders, and downstream distribution boards.

The distribution system can be divided into Feeder side and the Load side. The feeders are the generators and the loads are various ship board auxiliary machineries.

Electric power distribution systems are designed to serve their customers with reliable and high-quality power. The most common distribution system consists of simple radial circuits (feeders) ...
