

Steady-state analysis of relay protection

Overview

The new generation of intelligent substations has achieved online monitoring functions for secondary equipment, making some state variables of relay protection equipment become observable indicators. Relay system has excellent features, it is effective and safe protection measures, it can not only reduce the time the error was found, but also narrow the scope of failure, to ensure the normal operation of the other components. Therefore, the need of enhancing the models of protective relays in. The paper provides a case study based on the WSCC 9-bus system with overcurrent and under/over-voltage protections on the 230 kV sub-system.
