

Utilization of Damaged Optical Cables

Overview

Buried cables can be cut by earth-moving equipment and aerial cables can have trees fall on them. No cable is completely safe. Once an accident happens, there are two major problems: restoring service to the cable and doing it quickly to minimize the impact on customers. Fiber-optic cables are the backbone of modern connectivity—powering 5G networks, global internet backbones, and data center interconnections with near-light-speed data transmission. While these cables are engineered for durability (with some rated to last 25+ years), they are not invulnerable. They deliver enormous volumes of data through strands of glass thinner than a human hair. Every fiber optic cable installer or a company that deals in optical installation needs to know the reasons behind. Regardless of how well an outside plant optical fiber cable is installed, at some point it could be involved in a catastrophic accident.
