

What are optical module products used for

Overview

An optical module is a small device that moves data using light. It changes electrical signals into light signals and back again. This helps data travel faster and farther than with copper cables. Optical modules are very important for fast internet, cloud computing, and other. Optical modules are essential components in modern communication networks, enabling high-speed data transmission over fiber optic cables. These modules typically consist of a transmitter, which converts electrical signals into a light signal, and a receiver, which converts the received signal back. The optical module serves as a crucial component in optical fiber communication systems, operating at the physical layer, which is the lowest layer in the OSI model.

What are optical module products used for

An optical transceiver module, often simply called an optical module, acts as a signal conversion interface in fiber optic networks. It transforms high volumes of electrical signals into ...
