

Where are network patch panels used

Overview

A patch panel is primarily used to organize, manage, and route network cables in a structured and efficient way. It acts as a central point for neatly labeling and laying out all network cables, preventing tangled knots of CAT5 cables in a Local Area Network. Patch panels are one of the best ways to manage an expansive local area network (LAN) by providing quick and easy access to the ports and connections that connect them altogether. They come in a range of sizes, and are typically mountable, whether that's on a wall, or on a rack to make for easier. Whether for an office, data center, or industrial setup, patch panels keep networks reliable and professional. You may know a network switch, where LAN cables are connected to ports and you can see the cables clearly.
