

Where is the optical communication module located

Overview

The optical module serves as a crucial component in optical fiber communication systems, operating at the physical layer, which is the lowest layer in the OSI model. Its primary function is to achieve optoelectronic conversion by converting electrical signals into optical signals and vice versa. Operating at the physical layer of the OSI model, optical modules are core devices in optical. The optical module is one of the core devices of the optical communication system, and its development has a vital impact on its related industrial chain, from the upstream industry chip substrate, PCB to the downstream telecom market and data communication market, and the field of lidar driverless. An optical module is an electronic device that converts optical signals and electrical signals into each other. What are the roles of Optical Transceivers?

As a transmission medium between network devices, the optical module is a necessary hardware device for long-distance communication. This article will introduce you to the.
