

Which optical module is in

Overview

An optical module typically consists of an optical transmitter (TOSA, Transmitter Optical Sub-Assembly, containing a laser diode), an optical receiver (ROSA, Receiver Optical Sub-Assembly, containing a photodetector), functional circuits, and optical (electrical) interfaces. That is, metal medium communication represented by coaxial cables and network cables is gradually being replaced by optical fiber media. Composition of Optical Modules The optical module, known as Optical Transceiver in. The optical module serves as a crucial component in optical fiber communication systems, operating at the physical layer, which is the lowest layer in the OSI model. As the core optoelectronic devices operating at the Physical Layer of the OSI model, their. Integrated circuits and reference designs help you create a smaller and faster optical module design used in high-bandwidth data communication applications.
